

Preston Platform Transformer Temporary Loading Platforms for Multi-Story Construction

The Preston Platform Transformer (PPT) is a multi-purpose loading platform for use in high-rise building construction. It cantilevers from the face of the building being constructed and creates a landing site or pick up point for delivery or removal of construction materials and equipment by construction crane.

Because of its modular design the platform may be converted, or transformed, into more than 20 different products to serve as bridges, overhead protection, scaffold supports, or for many other functions. The PPT originated in Australia on or about 1991 and has been developed by Preston International Pty. Ltd. as a safe and cost efficient product that is simple to manufacture and to use.
