

Model Specifications for Construction and Demolition Waste Reduction and Reuse

WasteSpec is a manual that provides architects and engineers with both model specifications and background information about waste reduction, reuse, and recycling before and during construction and demolition. This manual includes model specifications tailored to all sixteen divisions of the Construction Specifications Institute (CSI) specifications system. Each manual provision includes cost implication symbols, background information on alternatives for handling construction and demolition waste, information specifically designed for bidders on how to estimate recyclable waste, a sample waste management plan, a checklist of materials and items typically contained in demolished buildings, and a list of resources for further information. WasteSpec was initiated by a committee representing a cross-section of the construction industry in a six-county area of North Carolina.
