

Five S All-Glass Facade

The Five S All-Glass Facade is a multipurpose glazing system in which the glazing is mounted in a stainless steel frame. The frame is welded at all corners and serves as the structural support. Each facade unit is prefabricated and its dimensions are limited only by their transportation and lifting possibilities. Beside the rapid installation of the facade, the system does not permit condensation between the glass sheets, has a low U value, has a high resistance to wind, is fire resistant, and resists burglary. The system also has very thin joints between adjacent transparent surfaces.
