

LYNX Digital Photo Management System

The LYNX Digital Photo Management System for Construction is a computer software application that enables a user to visually document a project using color digital cameras and to share this visual information with other people. LYNX combines the color digital camera with a secure high speed database and sophisticated file transfer functions that allow visual information to be instantly shared with others via direct modem connection, the Internet, or wide area network, and so on.

LYNX uses include documenting of job progress, inspection reports, litigation support, safety compliance verification among others. The ability to share this type of visual information results in quickly making more informed decisions by those involved in the construction process. It also offers an indisputable visual record of everything that happens on a day to day basis to supplement traditional written documentation.
