Approval by mail: Morocco: Clean and Efficient Energy Project (CTF) IBRD

Dear Patricia,

Thanks to the IBRD and Government of Morocco for submitting this proposal **which the UK approves.**

We continue to support IBRD's efforts to remove the regulatory barrier faced by the private sector to connect to the MV/LV grid. We also endorse the comment made by the independent reviewer with regards to extending the RE dispatching centre from the very beginning.

We have a few points that we would appreciate a response to:

- The CO2 savings and cost-effectiveness indicators presented on pg. 65 of the PAD are different to those presented in the table on pg. 60. The underlying data and assumptions provided support the ones included in the table. Could IBRD amend in the text?
- Additionally, do you think that it would it be possible to quantify the jobs that will be created both in the construction of the plants and their maintenance? We note that the developmental benefits of the project would be greatly advanced if there was an attempt to build local manufacturing capacity for some of the components of the plant as we have seen in the proposed MENA TA project document.

Kind regards,

Kate
